ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE AUTHOR REPORTS ON WORK UNDERTAKEN AT THE SCIENTIFIC RESEARCH INSTITUTE FOR CONCRETE AND REINFORCED CONCRETE ON THIS PROBLEM. HE POINTS OUT THAT THE METHOD OF LIMITING EQUILIBRIUM IS INAPPLICABLE FOR PROBLEMS IN WHICH THE STRESSED CONCRETE SHELL IS SIGNIFICANTLY DEFORMED, SINCE IT ASSUMES AND ESSENTIALLY STATIONARY SHELL. THE AUTHOR'S INVESTIGATIONS APPLY TO CYLINDRICAL SHELLS AND SHELLS OF POSITIVE GAUSSIAN CURVATURE. CONSIDERING THE DEFORMATIONS WHICH OCCUR AS THE MOVEMENT OF SEPARATE SECTIONS OF THE SHELL, SEPARATED BY HINGES OF VISCOUS FLOW, THE AUTHOR HAS ARRIVED AT THE EQUATIONS SHOWN ON MICROFISCHE.

SHUGAYEV, V. V.

"Determining the Bearing Capability of Sloping Reinforced Concrete Shells, Taking into Account Large Deflections"

Moscow, Stroitel'naya Mekhanika i Raschet Sooruzheniy, No. 1, 1970, pp. 7-12

Abstract: The author reports on work undertaken at the Scientific Research Institute for Concrete and Reinforced Concrete on this problem. He points out that the method of limiting equilibrium is inapplicable for problems in which the stressed concrete shell is significantly deformed, since it assumes an essentially stationary shell. The author's investigations apply to cylindrical shells and shells of positive Gaussian curvature.

Considering the deformations which occur as the movement of separate sections of the shell, separated by hinges of viscous flow, the author has arrived at the following equation:

$$\epsilon_x = \kappa_x z_c + \epsilon_x^0; \quad \epsilon_y = \kappa_y z_c + \epsilon_y^0 \quad (1)$$

where  $\epsilon_x^0$  and  $\epsilon_y^0$  are the deformation of the median surface of the shell, and  $\kappa_x$  and  $\kappa_y$  are changes in the normal curvature of the surface. The displacement of the neutral layer from the median surface is

USSR

SHUGAYEV, V. V., *Stroitel'naya Mekhanika i Raschet Sooruzheniy*, No. 1, 1970,  
pp. 7-12

$$c = \varepsilon_x^0 / \kappa_x = \varepsilon_y^0 / \kappa_y = \varepsilon_i^0 / \kappa_i ,$$

where  $\varepsilon_i^0$  is the intensity of axial deformation in the median surface. The operation of internal forces on an element of the shell surface  $dF$ , can be calculated from the formula

$$dT = \int_{-h/2}^{h/2} \sigma |\varepsilon_i| dF dz_c , \quad (2)$$

USSR

SHUGAYEV, V. V., *Stroitel'naya Mekhanika i Raschet Sooruzheniy*, No 1, 1970, pp 7-12

where  $h$  is the thickness of the shell. Thus, having observed experimentally that  $c = h/2$ , i.e., that the lines of deformation and tension along the thickness of the shell are of constant sign, the author arrives at

$$dT = \int_{-h/2}^{h/2} \sigma_0 \epsilon_i^0 dz_c dF + \int_{-h/2}^{h/2} \frac{\sigma_0}{c} z_c^2 \kappa_i dz_c dF = \sigma_0 \epsilon_i^0 h dF + \frac{\sigma_0 h^3}{12c} \kappa_i dF, \quad (3)$$

where  $\sigma_0$  is the tension in the median surface of the shell.

STUDIES OF STABILITY OF THE CORD DORSUM POTENTIAL (CDP) EVOKED BY SINGLE AND CONDITIONING STIMULATION OF AFFERENT NERVES

O. A. Shugurov

The State University, Dniepropetrovsk

Summary

Experiments were carried out on spinal and narcotized cats. Cord dorsum potentials GDP were recorded in the region of the lumbo-sacral enlargement after a single stimulus or a pair of stimuli delivered to the peripheral nerves with the time interval between them: 20 msec, 100 msec, 400 msec. Each record was made once in 15 sec. Number of records at each time interval was from 60 to 265.

Histograms of changes in the N<sub>1</sub>-component recorded after single and conditioned stimulus were plotted. After recalculation of single response histograms their coincidence with those obtained under conditioning was found. Variation coefficients were practically equal for both types of stimulation.

1/2

REEL/FRA  
19770581

2

AP0044107

Variation coefficient increased with a decrease of the single response amplitude. Conditioning of the low-amplitude responses did not change the variation coefficient as compared to the coefficient for the weak single responses.

It was shown that confidence intervals of the variation coefficient changes which were found in the conditioning experiments practically coincided with intervals obtained for single stimulation. A conclusion is made that presynaptic inhibition has no visible influence on the  $N_1$ -CDP component stability under conditions mentioned above.

"A Device for Correcting a Gyroscopic Angle-Data Transmitter"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obratzsy, Tovarnyye Znaki, No 10, Apr 72, Author's Certificate No 332323, Division G, filed 25 Sep 68, published 14 Mar 72, p 157

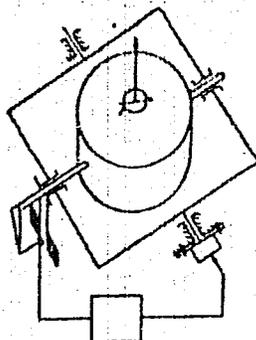

Translation: This Author's Certificate introduces a device for correcting a gyroscopic angle-data transmitter. The device contains a gyroscope in a Cardan suspension, a contact pickup of the angle of misalignment of the suspension frames, a relay, and a torque pickup. As a distinguishing feature of the patent, the accuracy and reliability of the device are improved by adding a delay unit for the relay release time, and by making the contact pickup of the angle of misalignment in the form of two brush contacts which are fixed to the outer frame and spaced by a gap in which a contact connected to the inner frame of the Cardan suspension of the gyroscope slides freely.

"Serum Alkaline Ribonuclease Activity in Carbon Tetrachloride Poisoned Rats and Effects of an In Vitro Hepatic Inhibitor"

Byul. Eksperim. Biol. i Med., Vol 74, No 9, 1972, pp 50-53 (from Referativnyy Zhurnal -- Biologicheskaya Khimiya, No 5, 1973, Abstract No 5F2279)

Translation: Serum activity of free alkaline RNase was found to increase 3 h after intraperitoneal administration of  $CCl_4$  to rats (0.3 ml/100 g in vegetable oil). In vitro addition to the serum of a partially purified inhibitor from the livers of intact rats, significantly inhibited the enzyme activity in sera obtained from control and  $CCl_4$ -treated rats. After 3 h, the free RNase activity in the sera decreased, and then commenced to increase to normal levels. The significance of the changes in the activity of free alkaline RNase in the sera associated with  $CCl_4$  treatment was discussed in relation to the transport of exogenous polymeric RNA to the liver.

"Medium-Energy Proton Synchrotron as Source of Intense Kaon Beams"

Moscow, Doklady Akademii Nauk SSSR, Vol 209, No 4, 1973, pp 819-821

Abstract: The best source for obtaining medium-energy kaons is a 5- to 7-Gev proton accelerator. It is difficult to determine current requirements at the present time, but if existing programs for the modernization of operating accelerators are considered, then apparently the immediate problem is to increase intensity by ~ 2 orders; that is, a medium current of 100 microamperes. This is not beyond present-day technical capabilities if a fast synchrotron with an injector-linear accelerator of the "meson factory" type is used.

the accelerating field, as well as the radiotechnical measurement and beam observation systems, were developed by the Radiotechnical Institute of the Academy of Sciences USSR. "Tyazhpromelektroproyekt" [State Planning Institute for the Planning of Electrical Equipment for Heavy Industry] designed the general-purpose electrotechnical devices and cable connections. The plan for the construction complex of the accelerator was developed by the State All-Union Planning Institute. The construction of the accelerator was under the general supervision of the State Committee for the Use of Atomic Energy USSR. The adjustment of individual systems and the overall adjustment and start-up of the accelerator were carried out by the Institute of High-energy Physics and the developers of the accelerator systems. The basic beam work was done by the Institute of High-energy Physics with the participation of the Radiotechnical Institute. The construction of the accelerator was begun in 1960, and all the basic construction and assembly work was completed at the beginning of

"Effect of Imperfections on Internal Friction of Superconductors During n-s Transition"

Leningrad, Fizika Tverdogo Tela, Vol 14, No 11, Nov 72, pp 3447-3448

Abstract: The article reports on further studies of the low-frequency internal friction of superconductors by the method of flexural vibrations. Previous articles by the authors reported that the internal friction peak  $Q^{-1}$  is detected during the n-s transition and its value does not vary appreciably with a change in the number of impurities in polycrystalline niobium. The present article studies the effect of extended structural imperfections on this peak in polycrystalline and single-crystal specimens of niobium. The  $Q^{-1}$  peak of a 99.8 percent deformed polycrystalline specimen has a width that considerably exceeds the width of the peak in a single crystal with a deformation of several percent. No peak is observed experimentally in a single-crystal specimen annealed at  $950^{\circ}C$  for an hour. No  $Q^{-1}$  peak is observed in

1/2

USSR

POSTNIKOV, V. S., et al., Fizika Tverdogo Tela, Vol 14, No 11, Nov 72, pp  
3447-3448

perfect single crystals, but it is observed in polycrystalline specimens (deformed and annealed) and single crystals with slight deformation, reaching a width of several tenths of a degree. Conclusion: Extended structural imperfections are responsible for such a substantial expansion of the temperature range; theoretical works have failed to consider the effect of these on the character of fluctuations.

"On the Use of an Accelerated Method to Determine the Fatigue Limit of Light Structural Alloys"

Moscow, Zavodskaya Laboratoriya, Volume 6, 71, pp 705-707

Abstract: The accelerated testing method under consideration was suggested by V. S. Ivanova in No. 5 of this journal for 1960, and is based on a similarity between fatigue destruction and melting. It is assumed that such factors as thermal working, small quantities of alloying materials and various design factors do not affect the criteria of fatigue. This is not true for edge stress concentrators, which retard plastic deformation in the region of a cut and increase the parameter  $\alpha$ .

Using data compiled in previous studies, the authors determined the relationship between the theoretical coefficient of stress concentration  $\alpha_0$  and the fatigue destruction criterion  $\alpha$ , considered the possibility of applying the accelerated method to alloys whose fatigue curves have no horizontal section and evaluated the error in determining fatigue limits for such alloys. The alloys covered were based on aluminum and magnesium. In no case did the Ivanova method

1/2

USSR

SHUKHMIN, Yu. A., Moscow, Zavodskaya Laboratoriya, Volume 6, 71, pp 705-707

introduce an error of greater than 6% in determining the fatigue limit. The effect of technological and design factors on the fatigue limit can be calculated, but the effects of different alloy compositions must be determined experimentally before Ivanova's method can be applied.

"Chronic Infection of Cells With Tickborne Encephalitis Virus. 7. Isolation of Cell Clones and Study of Their Properties"

Moscow, Voprosy Virusologii, No 5, 1971, p 623

Abstract: A study is presented of 15 cell clones isolated from chronically infected Hep-2-Soph cultures while protected by specific antibodies. The production of infectious tickborne encephalitis virus was detected in 13 clones where interference with WEE virus was observed and specific antigen was synthesized. The use of histochemical methods revealed three groups of cells with different metabolisms in each of the clones. The first group included degenerating cells found during the first 2 hours after subculturing. These cells contained an abundance of glycogen in the lyoform. They were also characterized by high succinic dehydrogenase activity with pronounced polymorphism of the formazan residue and low acid phosphatase activity. The second group of cells with normal morphology constituted most of the cell population. They were characterized by high succinic dehydrogenase activity, large content of lyo (dissolved) and granular glycogen, and high acid phos-

"Study of the Variability of Tickborne Encephalitis Virus. Report VI. Some Aspects of Immunogenesis in Mice Vaccinated With the Attenuated I-40 D Strain"

Moscow, Voprosy Virusologii, No 4, Jul/Aug 70, pp 405-408

Abstract: Following intracerebral inoculation of white mice with the pathogenic I-40 strain of tickborne encephalitis and the attenuated I-40 D strain (antigen and infectious virus), both viruses were isolated from the brain, blood, cervical lymph nodes, and spleen of the animals. All of the mice died 5 to 7 days later. After subcutaneous inoculation of I-40, the virus and antigen were found in the brain blood, cervical and mesenteric lymph nodes, spleen, and small intestine. After subcutaneous inoculation of I-40 D, however, the virus was found only in the lymph nodes and small intestine. The antigen (but not the infectious virus) was isolated from the brain. All of the animals infected subcutaneously with strain I-40 died within 9 days, while those so infected with strain I-40 D remained healthy throughout the 25-day observation period. Both oral and subcutaneous vaccination of mice with the I-40 D strain produced immunity to 1,000 LD<sub>50</sub> of tickborne encephalitis virus.

"Generation of Radiation in Na-H<sub>2</sub> and K-H<sub>2</sub> Mixtures During Pulsed Introduction of Metal Vapors into a Gas-Discharge Plasma"

Leningrad, Optika i Spektroskopiya, Vol XXXI, No 2, Aug 71, pp 324-325

Abstract: Generation of radiation in Na-H<sub>2</sub> and K-H<sub>2</sub> mixtures was produced in cold discharge tubes by the method of pulsed introduction of metal vapors into a gas-discharge plasma. This method, which eliminates the need for a heating element, involves the transmission of two current pulses through a discharge tube on the wall of which is a metallic layer of sodium (Na) or potassium (K). The first current pulse strips metal atoms from the walls of the tube and creates mixtures of Na-H<sub>2</sub> or K-H<sub>2</sub>. The metal vapors thus obtained are excited by the second current pulse, and radiation is generated. It was discovered that when the length of the first current pulse was increased, the generation of radiation on its trailing edge increased greatly in length, achieving a length of 300 microseconds. Several interesting new facts were established experimentally about generation of this type.

"A Device for Measuring the Thickness of Nonmagnetic Coatings on the Inside  
of Pipes"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obratzyy, Tovarnyye Znaki,  
No 7, Mar 72, Author's Certificate No 329373, Division G, filed 25 Mar 70,  
published 9 Feb 72, p 151

Translation: This Author's Certificate introduces a device for measuring  
the thickness of nonmagnetic coatings on the inside of pipes. The device  
contains a micrometer unit, a tubular bar, a movable rod, a force-measuring  
spring, and a head with a permanent magnet connected to the movable rod.  
The micrometer unit is fastened to the end of the tubular bar which is on  
the outside of the pipe to be inspected, and the movable rod is coaxial with  
the tubular bar and is coupled to the micrometer unit. The head with perma-  
nent magnet is fastened to the end of the tubular bar on the inside of the  
pipe to be inspected. As a distinguishing feature of the patent, the device  
is designed for improved accuracy in measuring the thickness of coatings on

the inside of long pipes, and especially those of small cross section. Inside the measurement head is a modular mechanism made up of two rollers wound with a flexible thread fastened by one end to the permanent magnet, and connected by the other end to the force-measurement spring. Also included in the device is a microcontact indicator of the position of the magnet fastened to one of its ends.

Name: Institute of Evolutionary Physiology and Biochemistry Acad.  
I. M. Sechenov (IZHIN), Leningrad

Description:

(U) During this quarterly reporting period, 14 new articles were located from the Institute of Evolutionary Physiology and Biochemistry named I. M. Sechenov (IZHIN). On the basis of these articles, it was possible to associate ten new persons with the Institute. Given below is a list of these persons, the subjects of the articles and the dates:

<u>Rogovin, Ya. Ya.</u>	antidiuretics	1970 (3)
<u>Zaitz, Ia.</u>	phospholipids	1969 (4)
<u>Gerasim, D. M.</u>	digestion	1970 (5)
<u>Lysin, A. V.</u>	muscle physiology	1970 (6)
<u>Kandel, V.</u>	phospholipids	1969 (7)
<u>Plavina, L. I.</u>	spectrophotometer	1970 (7)
<u>Pozharovskaya, L. F.</u>	phospholipids	1969 (4)
<u>Kudolyukov, S. A.</u>	nucleotides	1970 (8)
<u>Serebrenskaya, T. P.</u>	muscle physiology	1969 (9)
<u>Dobrynina, M. N.</u>	cholesterane	1970 (10,11)

Four of the articles were coauthored by persons already identified with the Institute. These articles dealt with nerve physiology (12), muscle physiology (11) and enzyme activity (14-16).

(U) A large number of persons have been identified with the Institute during the preceding quarterly reporting periods. To provide a ready source of reference, given below is a list of all the IZHIN staff members identified to the present time.

ABSTRACT. THE EXPTS. WERE PERFORMED ON ISOLATED OUTER SEGMENTS OF BOVINE RETINA AND ON BOVINE RHODOPSIN (R. N. ETINGOF, S. A. SHUKOLYUKOV, AND A. A. ZHUCHIKHINA, 1967) UNDER RED ILLUMINATION (650 NM). BOTH THE OUTER SEGMENTS AND RHODOPSIN (IN THE FORM OF DIGITONIN MICELLES) BOUND BROMOTHYML BLUE (I) BUT NOT BROMOCRESOL PURPLE (II). THIS ALLOWED SIMULTANEOUS DETECTION OF THE CHANGES IN H PRIME POSITIVE CONC. IN THE SEGMENT MEMBRANES AND IN THE SURROUNDING SOLN. THE PK OF I UPON BINDING INCREASED FROM 7.1 TO 8.5. THE ILLUMINATION OF "DARK" OUTER SEGMENTS OR DIGITONIN EXTS. OF RHODOPSIN WITH WHITE LIGHT (1500 LUX) DECREASED THE ABSORBANCE OF BOUND I WHILE IT INCREASED THE ABSORBANCE OF II. NO SIGNIFICANT DIFFERENCES IN I BINDING TO "DARK" SEGMENTS AND RHODOPSIN AND ILLUMINATED SEGMENTS WERE OBSD. THE CHANGES IN ABSORBANCE, PROBABLY DUE TO THE FORMATION OF A PH GRADIENT UNDER FUNCTIONAL LOAD, WERE DEPENDENT ON MANY POORLY CONTROLLABLE FACTORS AND COULD NOT BE INTERPRETED QUANT.

244129 HYDRAULIC VELOCITY TRANSDUCER comprises rotor 1 with inlet 2 and outlet 3, housing 4, load-valve 5 with spring 6, auxiliary spool 7 with spring 8, feed pump 9, bypass valve 10, and actuator 11 with spring 12. The centre of spool 7 is offset with respect to the rotor axis, and its gravity centre is located on a radius perpendicular to the spool axis. The position of valve 5 is set so that in case of uniform speed of the rotor the pressure in housing 4 is a function of angular velocity for control of the actuator. At higher speed than the setting, spool 7 compresses spring 8 and partly covers the return line 3 causing a pressure increase in the housing. This produces a signal for acceleration control, the rate of change of which can be adjusted by altering the mass of the spool and its spring.

"A Study of the Effects of the NK-5 Compound on the Biological Activity of  
Thio-TEPA"

Tashkent, Meditsinskiy Zhurnal Uzbekistana, No 7, Jul 71, pp 17-19

Abstract: Since most antitumor drugs cause serious injury to the hematopoie-  
tic system, an investigation was performed to establish whether the NK-5  
compound, administered in conjunction with the antitumor drug Thio-TEPA to  
young rats with sarcoma-45 transplant, would suppress the untoward effects of  
Thio-TEPA. Peripheral blood sample analyses performed throughout the test  
(one month) revealed that the NK-5 compound prevented a drop in leukocyte  
concentration and increased hemoglobin and erythrocyte concentration. More-  
over, these rats were growing significantly faster than the controls. Post-  
experimental histological examinations revealed small necrotic areas in the  
sarcoma transplants in rats treated with Thio-TEPA alone. In animals treated  
with Thio-TEPA and NK-5, the tumors had large necrotic areas in their central

1/2

"Stability and Free Oscillations of Close to Cylindrical Shells Subjected to a Twisting Moment"

V sb. Prochnost' i dinamika aviats. dvigateley. Vyp. 6 (Strength and Dynamics of Aircraft Engines--collection of works, No 6), Moscow, "Mashinostroyeniye", 1971, pp 37-68 (from RZh-Mekhanika, No 7, Jul 71, Abstract No 7V206)

Translation: The small-parameter method is used to study the problem of stability and free oscillations of shells of revolution which differ from cylindrical in their parabolic contour. It is shown for the investigated shells that there is a mutual influence between the stressed state due to the action of twisting moments distributed over the end face of the shell and the spectrum of natural frequencies. Approximate expressions are presented for the critical twisting moment which enable accounting for the slight deformation of the shell. A detailed description is given of the procedure for testing and for processing experimental data on the stability of close to cylindrical shells subjected to a twisting moment. Authors' abstract.

"Stability and Free Oscillations of Shells Close to Cylindrical When Subjected to Torque"

V sb. Prochnost' i dinamika aviats. dvigateley (Strength and Dynamics of Aircraft Engines—collection of works), vyp. 6, Moscow, "Mashinostro-yeniye", 1971, pp 37-68 (from RZh-Raketostroyeniye, No 7, Jul 71, Abstract No 7.41.188)

Translation: The small-parameter method is used to analyze the problem of stability and free oscillations of shells of revolution distinguished from cylindrical shells by a parabolic profile. For the shells which are studied, the authors determine the mutual influence of the stressed state caused by the action of twisting moments distributed over the end face of the shell, and the spectrum of natural frequencies. Approximate expressions are given for the critical torque. These expressions can be used to account for the slight flexibility of a shell. A detailed description is given of a procedure for carrying out tests and processing experimental data on the stability of close to cylindrical shells subjected to torque. Eight illustrations, two tables, bibliography of six titles.

"A Pulse Shaper"

USSR Author's Certificate No 296043, filed 8 Dec 69, published 6 Apr 71  
(from RZh-Avtomatika, Telemekhanika i Vychislitel'naya Tekhnika, No 10, Oct  
71, Abstract No 10B219 P)

Translation: The invention applies to the field of information-measurement and computer technology. The advantages of the proposed device are most fully realized in instruments designed for operations under field conditions with power supply from portable truck-mounted generators. Similar devices are known for shaping control pulses for a dekatron which are based on vacuum-tube, semiconductor, and gas-discharge devices. The analogs described in many instances are not very economical, require high-voltage power supplies, or are exceptionally slow. The proposed device is capable of operation at a supply voltage of 10-12 V, providing high speed (up to 100 kHz when operated with an OG-8 dekatron) and adequate economy. One illustration.

110529y Transformation of halogen-containing aromatic compounds in the presence of an organic base. K. Reaction of 8-halo-5-nitro-1-naphthoic acids with piperidine in benzene. Lisitsyn, V. N.; Shulchishin, V. A. (Mosk. Khim.-Tekhnol. Inst. im. Mendeleeva, Moscow, USSR). Zh. Org. Khim. 1970, 6(2), 325-9 (Russ). The kinetics were studied of piperidine (I) or piperidine-1-d (Ia) with 8-bromo-5-nitro-1-naphthoic acid (II) or its 8-chloro analog (IIa). The reaction is base-catalyzed (Cu salts have no effect) and obeys the equation  $dD/dt = k_1(A-x)(B-2x) + k_2(A-x)(B-2x)^2$  ( $D$  is halide ion concn.,  $A$  is the initial II or IIa concn.,  $B$  is the initial I or Ia concn.). The existence of a slight isotope effect suggests that the reaction mechanism involves no. only quaternary salt formation, but also H-bonding (or D-bonding). A cyclic intermediate is postulated, which rearranges to the 8-piperidino analog of II.

"Experimental Study of the Turbulent Boundary Layer on a Much Elongated Solid of Revolution in a Supersonic Flow"

Izvestiya sibirskogo otdeleniya Akademii Nauk SSSR, Seriya tekhnicheskikh nauk, No 8 (203), vyp. 2, Jun 1972, pp 41-46

Abstract: An experimental Study was performed to check the calculation techniques used to determine the characteristics of the boundary layer on an elongated solid of revolution in a supersonic flow. A model of the M-100 meteorological rocket without fins was used. It is a long hollow cylinder with ogive nose and shaft. The diameter of the cylindrical part was 25 mm with a total geometric elongation of  $\lambda = 40$ . Along the upper and lower generatrices of the cylindrical section there were 7 holes 0.6 mm in diameter to measure the static pressure  $P_w$  and 7 chromel-copel thermocouples to measure the surface temperature of the model  $T_w$ . The tests in a wind tunnel revealed that the wall law obtained for a turbulent boundary layer on a plate remains valid for the boundary layer on a cylinder at supersonic gas flow velocities to  $M = 6$ . With great elongation of the cylinder when the thickness of the boundary layer becomes commensurate  $1/2$

USSR

KOVALENKO, V. M., et al., *Izvestiya sibirskogo otdeleniya Akademii Nauk SSSR, Seriya tekhnicheskikh nauk*, No 8 (203), vyp. 2, Jun 1972, pp 41-46

with the radius, the basic characteristics of the boundary layer differ noticeably from the corresponding characteristics on a plate. In particular, when  $\lambda = 30-40$  the coefficients of friction, displacement area and momentum loss increased by 10-15%. The shape parameter  $H$  does not differ from the calculated value for a plate. The experimental data on the effect of the transverse curvature on the integral characteristics of the turbulent boundary layer and on the friction drag agree with those calculated by the semiempirical methods used previously [A. S. Ginevskiy, et al., *Izv. AN SSSR, otd. mekhaniki i mashinostroyeniya*, No 1, 1963; V. M. Kovalenko, *Tr. TsAGI*, No 1084, 1967].

"Turbulent Boundary Layer on a Circular Cylinder"

Novosibirsk, Izvestiya Sibirskogo Otdeleniya Akademii Nauk SSSR, Seriya Tekhnicheskikh Nauk, No 13(208), Issue 3, Oct 72, pp 6-16

Abstract: Formulas are derived for determining the principal characteristics of a compressed turbulent boundary layer on a circular cylinder in a supersonic flow: area of displacement, area of loss of momentum, form parameter, thickness of the boundary layer, and also the localized and average coefficients of friction drag. Curves are given showing these characteristics as functions of the basic flow parameters. A comparison with the case of a plate in an identical supersonic flow shows that the thickness of the boundary layer is less for a cylinder, while friction drag increases, and the form parameter changes little. The influence of the transverse curvature of the surface increases with an increase in the Mach number and temperature factor, and with a decrease in Reynolds number.

No 13(208), Issue 3, Oct 72, pp 8-16

Curves for the ratio of average coefficients of friction drag for a cylinder and a plate in the same supersonic flow show that the theory of calculation of this ratio needs improvement. Comparison of the theoretical results with experimental data shows satisfactory agreement in general. V. M. Kovalenko thanks A. A. Boldyrev, Yu. P. Sergeyev and Yu. G. Shvalev who helped with boundary-layer experiments.

"A Turbulent Boundary Layer on a Long, Thin Filament"

Novosibirsk, Izvestiya Sibirskogo Otdeleniya Akademii Nauk SSSR, Seriya Tekhnicheskikh Nauk, Issue 1, No 3, 1973, pp 56-67

Abstract: The effect of transverse surface curvature on the characteristics of a turbulent boundary layer has been dealt with in a number of studies; the present research consisted of experimental investigation of the characteristics and structure of a boundary layer on extended flow-around circular cylinders with elongation up to 2,500. The observations were made with use of the ITPM T-324 low-turbulence wind tunnel.

In the studied range of Reynolds numbers  $Re = (6-15) \cdot 10^6$ , with elongations  $\lambda = 1,020-2,500$ , the boundary layer in the case of longitudinal flow-around of a circular cylinder was found to be purely turbulent, and quite different from the corresponding boundary layer of a smooth plate. Its thickness, for example, is less by a factor of 2 or more, the velocity profiles are fuller, and the value of the form parameter  $H$  is 16% lower, while the value of  $1/2$

KOVALENKO, V. M., and SHULEMOVICH, V. M., Izvestiya Sibirskogo Otdeleniya Akademii Nauk SSSR, Seriya Tekhnicheskikh Nauk, Issue 1, No 3, 1973, pp 56-67

friction drag is 53-69% higher, than in the case of the plate. Turbulence intensity distribution is qualitatively different as well, this being explained by the altered character of turbulence energy generation across the thickness of the boundary region.

Values of the form parameter of the boundary layer, thickness of the layer, and mean friction drag, as obtained experimentally for very large elongations of the cylinder ( $\lambda \leq 2,500$ ) are in close agreement with results obtained by other investigators.

Study of Geoactive Corpuscles and Photoelectrons

(Abstract: "Study of Geoactive Corpuscles and Photoelectrons on the 'Kosmos-261' Satellite," by A. D. Bolyunova, M. L. Bragin, Yu. I. Galperin, V. A. Gladyshev, N. V. Dzhordzhio, G. N. Zlotin, I. N. Kiknadze, R. A. Kovrazhkin, T. N. Mulyarchik, Yu. N. Ponomarev, V. V. Tenny, N. I. Fedorova, Yu. P. Shilyayev, F. K. Shuyskaya and R. V. Shulenina, Moscow, Kosmicheskiye Issledovaniya, Vol VIII, No 1, 1970, pp 104-136)

The artificial earth satellite "Kosmos-261" was used in a study of low-energy geoactive corpuscles and fresh photoelectrons and their interaction with the earth's upper atmosphere. The satellite was launched on 10 December 1968. Orbital inclination to the equator was 71°, so that for a relatively long time it moved almost along a tangent along the auroral zone over the Soviet Far North, making it possible to increase the volume of simultaneous measurements from the satellite and from ground observatories. The storage regime made it possible to extend continuous measurements for periods of several revolutions, including passes over the auroral zones in the Arctic and Antarctic and over the polar caps as far as invariant geomagnetic latitudes 82-85°. During the initial period the satellite apogee was at 670 km and perigee was at 217 km, but it finally

AP0042570.

burnt up upon entering into the dense layers of the atmosphere on 22 February 1969 after making 857 revolutions of the earth. The experiment lasted 53 days. The orbit was such that in the northern hemisphere middle and high latitudes the satellite moved below or close to the maximum of the Foreion so that ionospheric electron density along its trajectory and its variations could be determined in a number of regions on the basis of measurements by ground ionospheric stations. The period of the experiment included both quiet periods and those with strong disturbances. The experiment was conducted under the "Program of Cooperation Among Socialist Countries in the Field of Space Research and Peaceful Use of Space." Ground measurements were made in Bulgaria, Hungary, East Germany, Poland, Rumania, USSR and Czechoslovakia. Observatories and special expeditionary stations in the USSR participated: in Yakutia, the Far North, Siberia and middle latitudes. The article cited below is divided into four parts: 1) Description of Experiment; 2) Measurement of Low-Energy Electrons; 3) Measurement of Low -Energy Ions; 4) Measurements of Charged Particles with Intermediate and High Energies. Parts 2)-4) are essentially independent articles and are abstracted separately.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. A STUDY WAS MADE OF TIDAL INTERNAL WAVES IN THE TROPICAL ATLANTIC ON THE BASIS OF MEASUREMENTS OF TEMPERATURE WITH PHOTOTHERMOGRAPHS IN TWO REGIONS OF THE TRADE WINDS ZONE IN THE ATLANTIC. A NETWORK OF SELF CONTAINED BUOY STATIONS OUTFILLED WITH PHOTOTHERMOGRAPHS WAS SET OUT IN THE NORTHERN PART OF THE BRAZILIAN BASIN AND IN THE SOUTHERN PART OF THE SOUTH AFRICAN BASIN, THAT IS, IN THE ZONES OF THE SOUTHEAST AND NORTHEAST TRADES RESPECTIVELY. THE RECORDS REVEALED A VERY GREAT TEMPERATURE VARIABILITY. TEMPERATURE VARIATIONS WITH A SEMIDIURNAL PERIOD HAVE AN AMPLITUDE ATTAINING 1.3 DEGREE SC WHEREAS VARIATIONS WITH PERIODS OF TENS OF MINUTES HAVE AN AMPLITUDE OF ABOUT 0.3 DEGREE SC. (THESE ARE THERMOCLINAL MEASUREMENTS.) IN THE NORTHEAST TRADES REGION THERE ARE SEMIDIURNAL INTERNAL WAVES PROPAGATING IN A NORTHEASTERLY DIRECTION WITH A VELOCITY EXCEEDING 3 M TIMES SEC NEGATIVE PRIMEL. IN THE SOUTHEAST TRADES REGION THERE ARE SEMIDIURNAL INTERNAL WAVES PROPAGATING IN A SOUTHWESTERLY DIRECTION WITH A VELOCITY LESS THAN 3 M TIMES SEC NEGATIVE PRIMEL. THE DEGREE OF EXPRESSION OF THESE WAVES WAS CONSIDERABLY WEAKER THAN IN THE NORTHEAST TRADES ZONE AND THE ACCURACY IN DETERMINING THEIR PARAMETERS WAS CONSIDERABLY POORER. A COMPARISON OF THE DIRECTION OF PROPAGATION OF INTERNAL WAVES IN THE NORTHERN AND SOUTHERN REGIONS INDICATES THAT THE REGION OF EXCITATION OF THESE WAVES MAY BE THE EQUATORIAL REGION OF THE MID ATLANTIC RIDGE WHERE THE LATTER EXTENDS ALMOST ALONG THE PARALLEL.

Moscow, Fizika i Khimiya Obrabotki Materialov [The Physics and Chemistry of Materials Processing], No 6, Nov-Dec 73, pp 123-126.

Abstract: It is demonstrated that the high probability of formation of cracks in the zone around a welded seam in molybdenum results from the disappearance of the cellular structure of the metal during welding, the sharp drop in solubility of interstitial impurities and the separation of carbide particles, around which significant local phase hardening occurs.

Moscow, Meditsinskaya Parazitologiya i Parazitarnyye Eczlezni, Vol 40, No 3, May/Jun 71, pp 275-283

Abstract: The annual incidence of tickborne encephalitis is high in the Udmurt ASSR. In some years, it was 18% of all recorded diseases. Data on the disease as it occurred from 1956 to 1965 were studied. The results of these studies led to a sharp reduction in incidence of the disease in the Udmurt ASSR. Statistical data on the disease level are presented in bar graphs for various regions over the 10-year period. Various forests in the area were characterized by their degree of epidemic danger, based on preliminary mapping of the occurrence and recurrence of infections. Subsequently, tick-extermination areas (amounting to 7% of the entire forest lands) were set aside and ticks eliminated by aerial spraying. Gamma-globulin prophylaxis and vaccination are recommended for the population living in areas in which tick eradication is difficult to achieve or impractical.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THIS IS A CONTINUATION OF SHULEYKIN'S EARLIER ARTICLES (V. V. SHULEYKIN, DAN, 186, NO 3, 1969, 578; DAN, 189, NO 6, 1969). HIS APPROACH TO THE STUDY OF HURRICANES IS THE USE OF A SIMPLIFIED MODEL OF THE FIELD OF A TROPICAL HURRICANE BASED ON ITS REPRESENTATION AS A HEAT ENGINE "OF THE FIFTH KIND" FOR WHICH THE HEATER IS THE WATERS OF A WARM SURFACE CURRENT AND WHOSE CONDENSER IS ALL THE SURROUNDING HALF SPACE. SIMPLE EXPRESSIONS HAVE BEEN DERIVED WHICH CONTAIN ONLY ALGEBRAIC FUNCTIONS, FROM WHICH IT IS POSSIBLE TO ESTABLISH A RELATIONSHIP AMONG THE VARIOUS PARAMETERS OF THE HURRICANE FIELD. IN THIS ARTICLE AN ATTEMPT IS MADE TO FIND A CORRELATION BETWEEN THE TEMPERATURE OF THE UNDERLYING OCEAN WATER AND THE POWER WHICH IS RELEASED DURING CONDENSATION OF THE VAPOR RISING IN ASCENDING CURRENTS IN THE "NUCLEUS" OF THE HURRICANE (IN THE DISTANCE FROM THE "EYE" TO APPROXIMATELY ONE THIRD THE RADIUS OF THE ENTIRE HURRICANE FIELD). THIS APPROXIMATE INVESTIGATION HELPS IN UNDERSTANDING THE REASON FOR THE UNPRECEDENTED DESTRUCTION FROM HURRICANE CAMILLE IN 1969. AT ONE OF ITS STAGES IT PASSED IN THE GULF OF MEXICO OVER WATER HAVING A TEMPERATURE OF ABOUT 32DEGREES, WHEREAS ON THE MAP IN THE SOVIET MARINE ATLAS THE MEAN LONG TERM TEMPERATURE OF THE SURFACE WATER AT THIS TIME OF YEAR IN THIS AREA IS LESS THAN 29DEGREES. THE ENERGY RELEASED BY THIS HURRICANE WAS TWICE AS GREAT AS FOR THE MOST COMMONLY OBSERVED ATLANTIC HURRICANE PASSING OVER A WARM CURRENT WITH A SURFACE TEMPERATURE OF 27DEGREES.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. WITH THE AID OF TEMP. SHIFT  
 EXPTS., THE IS MUTANTS OF TEMPERATE BACTERIOPHAGE M15 WERE DIVIDED INTO  
 2 GROUPS, EARLY AND LATE ONES. PHAGE DNA REPLICATION WAS NORMAL IN  
 LATE MUTANTS AT ELEVATED TEMP. BOTH IN THE VEGETATIVE AND PROPHAGE  
 STATES, WHEREAS SUCH REPLICATION WAS DISTURBED UNDER THE SAME CONDITION  
 IN BOTH STATES IN EARLY MUTANTS. THIS DISTURBANCE RESULTED IN THE  
 INTENSIVE CURING OF EARLY MUTANT LYSOGENS UNDER NONPERMISSIVE  
 CONDITIONS. PROPHAGE M15 DNA SEDIMENTED IN SUCROSE GRADIENTS SEP. FROM  
 BACTERIAL DNA. THE CONCLUSION WAS DRAWN THAT PROPHAGE M15 WAS NOT  
 INCORPORATED INTO THE BACTERIAL CHROMOSOME. SOME OTHER PROPERTIES OF  
 PHAGE M15 AND ITS DNA WERE DESCRIBED. FACILITY: INST. GEN.  
 GENET., MUSCCW, USSR.

**A70-23391 #** Dynamic problems of the theory of elasticity for simply connected domain (Dinamichna zadacha teorii pruzhnosti dlia odnoz'iaznoi oblasti). M. O. Shul'ga (Akademiia Nauk Ukrain'skoi RSR, Institut Mekhaniki, Kiev, Ukrainian SSR). Akademiia Nauk Ukrain'skoi RSR, Dopovid, Seriya A-Fiziko-Tekhnichni i Matematichni Nauki, vol. 32, Jan. 1970, p. 59-62. 6 refs. In Ukrainian.

On the basis of the previously obtained solution for the Helmholtz equation in curvilinear coordinates the method is suggested for reduction of external plane stationary dynamic problems of the theory of elasticity for simply connected domains to the infinite systems of algebraic equations.

"Coherent Bremsstrahlung of Electrons and Positrons of Ultrahigh Energy  
in Crystals"

Moscow, Pis'ma v Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, Vol  
13, No 12, 20 Jun 71, pp 713-715

Abstract: The authors find that the bremsstrahlung of electrons and positrons has a coherent character for small angles of slope  $\theta$  of the primary beam to the axis of the crystal. The theory of the effect in the first Born approximation has been described previously. In this approximation the radiation from electrons and positrons is the same. Here the authors wish to show that at sufficiently small angles  $\theta$  the coherent effect increases the relative contribution of the second and higher Born approximations, which, in turn, leads to a substantial difference in the radiation from electrons and positrons at small angles  $\theta$  even in crystals of light elements, but they note that the incoherent part does not act in the same manner. They are able to prove their assumptions through use of a mathematical apparatus. The article contains 4 bibliographic entries.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE INVESTIGATION CONFIRMED THE PRESENCE OF 2 TYPES OF PHENOMENA LEADING TO THE 475DEGREES BRITTLENESS IN HIGH CR STEELS KH17 AND KH28 WHICH WAS EARLIER OBSERVED IN KH25. (1) WHILE HOLDING AT BRITTLENESS TEMP. UP TO 1 HR, FORMATION OF AN ORDERED ZONE TAKES PLACE WHICH LOWERS PLASTICITY, MAINLY IN THE LIMITS OF THE CHROME FERRITE SECTION. (2) WITH FURTHER HOLDING TIME, AN INTRAPHASE DECOMPN. OF FERRITE TO 2 SOL. SOLNS. ALL ALONG THE GRAINS WAS OBSD. WHICH WERE DIFFERENT IN COMPN. FROM CR. THE LARGEST EFFECT ON EMBRITTLEMENT WAS HOMOGENEITY OF THE SOL. SOLN. WITH INCREASE IN INHOMOGENEITY OF THE DISTRIBUTION OF CR, THE EMBRITTLEMENT PROCEEDS FOLLOWING ONLY SEVERAL MIN OF HEATING AT 450-520DEGREES.

CIRC ACCESSION NO--AP0105639  
 ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. ELEVEN DISPERSION HARDENED,  
 PRECISION ALLOYS Fe-NI-AL-CO (RANGES NI 13.5-19.6, AL 7.0-12.27, CO  
 12.0-36.5, SI 0.0-0.5, TI 0.24-7.0 OR NB 0.5-0.8 WT. PERCENT, FE REST)  
 WERE STUDIED AS TO THE EFFECT OF ULTRASOUND ON PROPERTIES AND STRUCTURE.  
 ALL SPECIMENS WERE HEATED TO 1250-80DEGREES, HELD FOR 15-20 MIN, AND  
 COOLED TOGETHER WITH THE FURNACE AT 20DEGREES PER HR. THE  
 THERMOMAGNETIC TREATMENT WAS CARRIED OUT BY HEATING IN A BAOL SUB2 BATH  
 AT 800-40DEGREES FOR 10 MIN, FURTHER HEATING ALSO IN BAOL SUB2 AT  
 1280DEGREES FOR 10-15 MIN. COOLING IN LOWER TEMP. RANGE AT THE CRIT. RATE  
 40-60DEGREES PER MIN IN A MAGNETIC FIELD. BEFORE THE ULTRASONIC  
 TREATMENT THE FOLLOWING ALTERNATIVE THERMAL TREATMENTS WERE APPLIED: (1)  
 HEATING TO 1250-80DEGREES, COOLING IN THE LOWER TEMP. RANGE  
 (400-850DEGREES) AT 40-60DEGREES PER MIN AND TEMPERING AT 600DEGREES,  
 (2) STEPWISE HEATING AND COOLING AT CRIT. RATE FROM 1280DEGREES IN A  
 MAGNETIC FIELD, (3) THE ABOVE MENTIONED THERMOMAGNETIC TREATMENT WITH  
 TEMPERING FOR 4 HR AT 600DEGREES, AND (4) STEPWISE HEATING AND COOLING  
 WITH CRIT. RATE IN MAGNETIC FIELD (WITHIN THE REGION OF SOLID SOLN.)  
 WHILE APPLYING ULTRASOUND DURING TEMPERING AT 600DEGREES WITH VARYING  
 TIME PERIODS. THE IRRADN. WITH ULTRASOUND WAS CARRIED OUT AT 18-20 KHZ  
 IN A MAGNETIC FIELD OF 1500-2000 OE. AFTERWARDS, THE MICROSTRUCTURE,  
 MAGNETIC PROPERTIES, SP. ELEC. RESISTANCE, THERMAL EXPANSION,  
 MICROHARDNESS, INTERNAL FRICTION, HEAT COND., AND YOUNG MODULUS WERE  
 DETD. THE ULTRASOUND AFTER TREATMENTS (1) AND (3) HAD NO EFFECT, WHILE  
 TREATMENT (2) AND ULTRASOUND HAD A WEAK EFFECT ON MAGNETIC PROPERTIES.
